Today's plan

- Kahoot Quiz
- Recap
- Problem Sets 16, 17, 18, 19
- Consultation

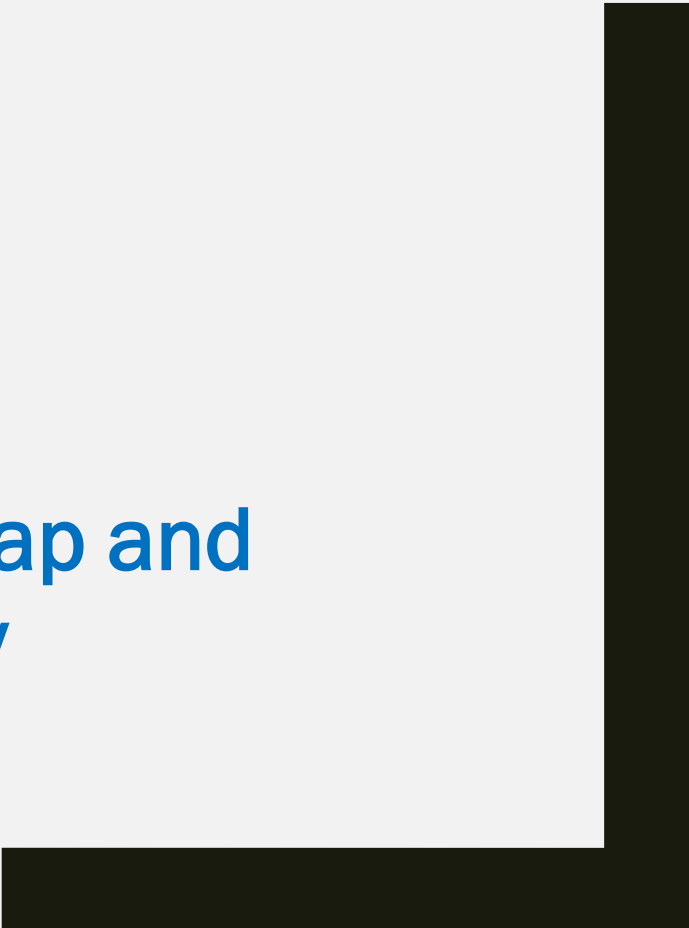

The background of the image is a stylized world map divided into four quadrants by a vertical and a horizontal line. The top-left quadrant is red, the top-right is blue, the bottom-left is yellow, and the bottom-right is green. The word "Kahoot!" is written in a large, white, rounded font across the center of the image, with the exclamation mark positioned at the end of the word in the green quadrant.

Kahoot!

RECAP

Strings, Call-by-reference, Heap and
Multidimensional Array

```
void swap(long *a, long *b) {  
    long temp = *a;  
    *a = *b;  
    *b = temp;  
}
```

```
long a = 10;
```

```
long b = -4;
```

```
swap(&a, &b);
```

swap

main

```
void swap(long *a, long *b) {  
    long temp = *a;  
    *a = *b;  
    *b = temp;  
}
```

```
long a = 10;
```

```
long b = -4;
```

```
swap(&a, &b);
```

swap

main

```
void swap(long *a, long *b) {  
    long temp = *a;  
    *a = *b;  
    *b = temp;  
}
```

```
long a = 10;
```

```
long b = -4;
```

```
swap(&a, &b);
```

swap

main

```
void swap(long *a, long *b) {  
    long temp = *a;  
    *a = *b;  
    *b = temp;  
}
```

```
long a = 10;
```

```
long b = -4;
```

```
swap(&a, &b);
```

swap

main

```
void swap(long *a, long *b) {  
    long temp = *a;  
    *a = *b;  
    *b = temp;  
}
```

```
long a = 10;
```

```
long b = -4;
```

```
swap(&a, &b);
```

Why malloc

- We cannot use **fixed length array** unless we know for sure that the input size is limited, and we cannot use **variable-length array on the stack**, since we may get a segmentation fault if the array size is too big for the stack.
 - *The only viable solution is to allocate a **variable-length array on the heap** using **malloc***

```
long a[3];
```

```
long (*p)[3]; // p is a pointer to an array
```

```
p = &a; // points p to the address of array a
```

```
if (p == a) {
```

```
    cs1010_println_string("same");
```

```
}
```

```
(*p)[2] = 1; // ok
```

```
(*a)[2] = 1; // error
```

PROBLEM SETS

16, 17, 18, 19

Problem Set 16.1

Write the following functions (without calling the standard C functions declared in `<string.h>` such as `strlen`, `strcmp`, `strstr`)...

https://github.com/DigiPie/cs1010_tut_c09/blob/master/Tutorial_7/problem16_1.c

PROBLEM SETS

16, 17, 18, 19

Problem Set 17.1

Complete the function `find_min_max` that takes in a length and an array containing long values of size length, and update the parameter `min` and `max` with the minimum and the maximum value from this array, respectively. Show how to call this function from `main`.

https://github.com/DigiPie/cs1010_tut_c09/blob/master/Tutorial_7/problem17_1.c

PROBLEM SETS

16, 17, 18, 19

Problem Set 17.2

```
void foo(double *ptr, double trouble) {  
    ptr = &trouble;  
    *ptr = 10.0;  
}  
  
int main() {  
    double *ptr;  
    double x = -3.0;  
    double y = 7.0;  
    ptr = &y;  
    foo(ptr, x);  
    cs1010_println_double(x);  
    cs1010_println_double(y);  
}
```

What would be printed?

Problem Set 17.2

```
void foo(double *ptr, double trouble) {  
    ptr = &trouble;  
    *ptr = 10.0;  
}  
  
int main() {  
    double *ptr;  
    double x = -3.0;  
    double y = 7.0;  
    ptr = &y;  
    foo(ptr, x);  
    cs1010_println_double(x);  
    cs1010_println_double(y);  
}
```

What would be printed?

-3.0

7.0

Because in foo,

*ptr and trouble are
automatic variables.

Problem Set 17.2

```
void foo(double *ptr, double trouble) {  
    ptr = &trouble;  
    *ptr = 10.0;  
}  
  
int main() {  
    double *ptr;  
    double x = -3.0;  
    double y = 7.0;  
    ptr = &y;  
    foo(ptr, x);  
    cs1010_println_double(x);  
    cs1010_println_double(y);  
}
```

main

Problem Set 17.2

```
void foo(double *ptr, double trouble) {  
    ptr = &trouble;  
    *ptr = 10.0;  
}  
  
int main() {  
    double *ptr;  
    double x = -3.0;  
    double y = 7.0;  
    ptr = &y;  
    foo(ptr, x);  
    cs1010_println_double(x);  
    cs1010_println_double(y);  
}
```

Problem Set 17.2

```
void foo(double *ptr, double trouble) {  
    ptr = &trouble;  
    *ptr = 10.0;  
}  
  
int main() {  
    double *ptr;  
    double x = -3.0;  
    double y = 7.0;  
    ptr = &y;  
    foo(ptr, x);  
    cs1010_println_double(x);  
    cs1010_println_double(y);  
}
```

Problem Set 17.2

```
void foo(double *ptr, double trouble) {  
    ptr = &trouble;  
    *ptr = 10.0;  
}
```

```
int main() {  
    double *ptr;  
    double x = -3.0;  
    double y = 7.0;  
    ptr = &y;  
    foo(ptr, x);  
    cs1010_println_double(x);  
    cs1010_println_double(y);  
}
```

main

PROBLEM SETS

16, 17, **18**, 19

Problem Set 18.1

- Draw the call stack and the heap, showing what happened when we run the following code.

```
void foo(long *y, long *z) {  
    y[0] = -7;  
    y[1] = -8;  
    z[0] = 4;  
    z[1] = 5;  
}
```

```
int main() {  
    long y[2] = {1, 2};  
    long *z = calloc(2, sizeof(long));  
    z[0] = y[0];  
    z[1] = y[1];  
    foo(y, z);  
}
```

```
void foo(long *y, long *z) {
```

```
    y[0] = -7;
```

```
    y[1] = -8;
```

```
    z[0] = 4;
```

```
    z[1] = 5;
```

```
}
```

```
int main() {
```

```
    long y[2] = {1, 2};
```

```
    long *z = calloc(2, sizeof(long));
```

```
    z[0] = y[0];
```

```
    z[1] = y[1];
```

```
    foo(y, z);
```

```
}
```

main

```
void foo(long *y, long *z) {
```

```
    y[0] = -7;
```

```
    y[1] = -8;
```

```
    z[0] = 4;
```

```
    z[1] = 5;
```

```
}
```

```
int main() {
```

```
    long y[2] = {1, 2};
```

```
    long *z = calloc(2, sizeof(long));
```

```
    z[0] = y[0];
```

```
    z[1] = y[1];
```

```
    foo(y, z);
```

```
}
```

```
void foo(long *y, long *z) {
```

```
    y[0] = -7;
```

```
    y[1] = -8;
```

```
    z[0] = 4;
```

```
    z[1] = 5;
```

```
}
```

```
int main() {
```

```
    long y[2] = {1, 2};
```

```
    long *z = calloc(2, sizeof(long));
```

```
    z[0] = y[0];
```

```
    z[1] = y[1];
```

```
    foo(y, z);
```

```
}
```

```
void foo(long *y, long *z) {
```

```
    y[0] = -7;
```

```
    y[1] = -8;
```

```
    z[0] = 4;
```

```
    z[1] = 5;
```

```
}
```

```
int main() {
```

```
    long y[2] = {1, 2};
```

```
    long *z = calloc(2, sizeof(long));
```

```
    z[0] = y[0];
```

```
    z[1] = y[1];
```

```
    foo(y, z);
```

```
}
```

main

PROBLEM SETS

16, 17, 18, 19

Problem Set 18.2

■ When is realloc useful?

```
char *p = calloc(size, sizeof(char));
```

```
// some time later
```

```
if (i == size) {
```

```
    size *= 2;
```

```
    p = realloc(p, size); // double array size
```

```
}
```

PROBLEM SETS

16, 17, 18, 19

Problem Set 19.1

- a) Write a function `add` that performs 3x3 matrix addition. The function should operate on 3x3 matrices of `long`, takes in three parameters, the first two are the operands for addition and the third is the result.
- b) Write a function `multiply` that performs 3x3 matrix multiplication. The function should operate on 3x3 matrices of `long`, takes in three parameters, the first two are the operands for multiplication and the third is the result.

Problem Set 19.1 a)

```
void add(long a[][3], long b[][3], long c[][3]) {  
    for (int i = 0; i < 3; i += 1) {  
        for (int j = 0; j < 3; j += 1) {  
            c[i][j] = a[i][j] + b[i][j];  
        }  
    }  
}
```

Problem Set 19.1 b)

```
long row_to_col(long a[][3], long b[][3], int row, int col) {  
    long sum = 0;  
    for (int i = 0; i < 3; i += 1) {  
        sum += a[row][i] * b[i][col];  
    }  
    return sum;  
}  
  
void mul(long a[][3], long b[][3], long c[][3]) {  
    for (int i = 0; i < 3; i += 1) {  
        for (int j = 0; j < 3; j += 1) {  
            c[i][j] = row_to_col(a, b, i, j);  
        }  
    }  
}
```

PROBLEM SETS

16, 17, 18, 19

Problem Set 19.2

We need to represent the distance in km between every major cities in the world. Let's label every city with a number, ranging from 0 .. $n-1$, where n is the number of cities. The distance between city i and j is the same as the distance between city j and i . The distance can be represented with long.

Explain how you would represent this information using jagged two-dimensional array in C efficiently. We have information of a few thousand cities to store.

Explain how you would write `long dist(long **d, long i, long j)` to retrieve the distance between any two cities i and j .

Problem Set 19.2

0	0				
1		0			
2			0		
3				0	
4					0
	0	1	2	3	4

j

- So, a matrix element $d[i][j]$ is valid only if $i \geq j$.
- $\text{dist}(d, i, j)$ should return $d[i][j]$ if $i \geq j$, $d[j][i]$ otherwise.
- $d[i][i]$ should be 0

THE END
